

Analysis Report: Relationship Between Instagram and WhatsApp Usage

1. Motivation

In daily life, the amount of time spent on social media platforms reflects digital behavior. Among the most popular platforms, Instagram and WhatsApp serve distinct purposes: content consumption and communication, respectively. This study aims to analyze personal social media usage habits to uncover the correlation between Instagram and WhatsApp usage times.

2. Hypothesis Formulation and Testing

Null Hypothesis (H_0):

There is no significant relationship between Instagram and WhatsApp usage times ($r=0$ or $r=0$).

Alternative Hypothesis (H_1):

There is a significant relationship between Instagram and WhatsApp usage times ($r \neq 0$ or $r \neq 0$).

Test Results:

Using linear regression:

- $p\text{-value} = 6.5993 \times 10^{-1} = 0.65993$
- $\alpha = 0.05$

Since $p > \alpha$, we fail to reject the null hypothesis.

Conclusion:

There is no significant relationship between Instagram and WhatsApp usage times. The observed data does not provide sufficient evidence to conclude that the usage of one platform influences the other.

3. Linear Regression Analysis

- Slope: -0.0524
- Intercept: 127.7266
- Correlation Coefficient (r): -0.0838
- P-value: 6.5993e-01

- Standard Error: 0.1179

The weak correlation coefficient and high p-value support the lack of a significant relationship.

4. Analysis of Visualizations

- Histogram Analysis:

Instagram usage shows a wider spread compared to WhatsApp, indicating greater variability. Both distributions have peaks, suggesting consistent patterns on certain days.

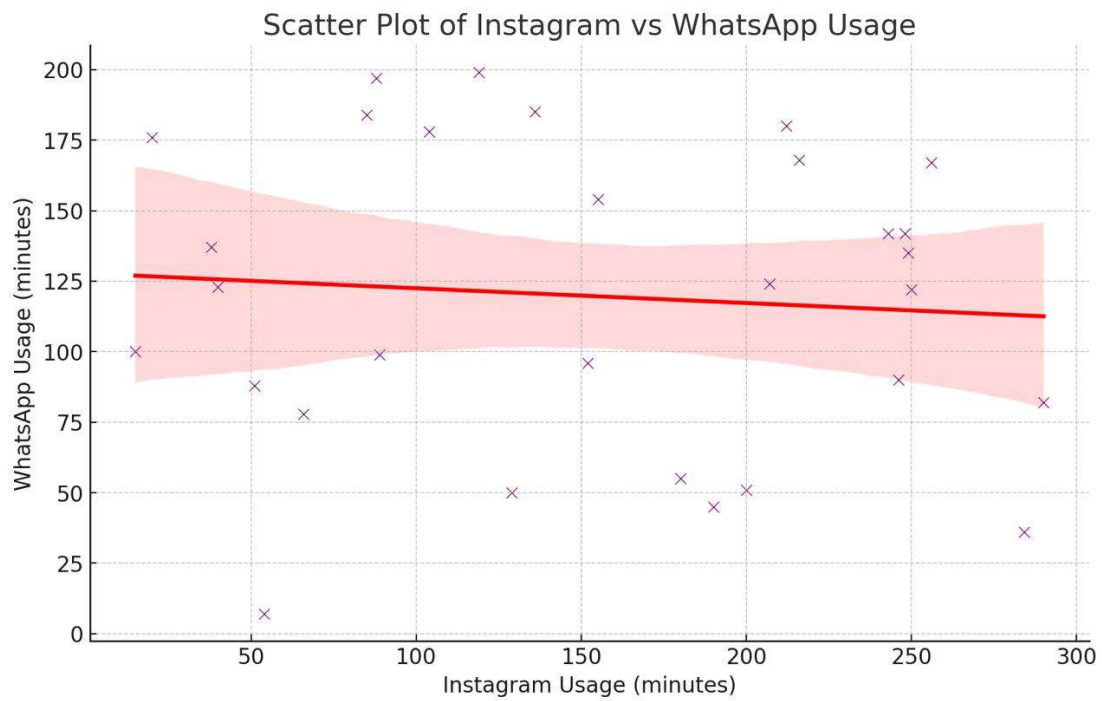

- Box Plot Analysis:

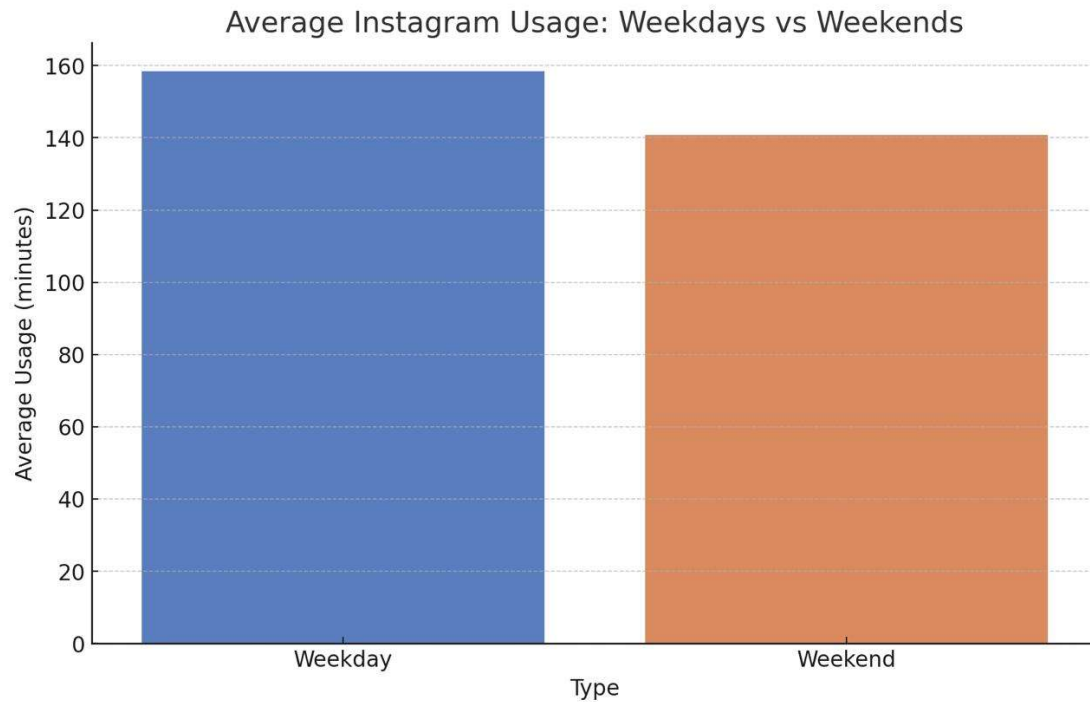

Instagram usage has a higher median and more outliers than WhatsApp, reflecting occasional high-usage days.

- Scatter Plot Analysis:

The scatter plot and regression line suggest a negative slope. However, this trend is not statistically significant.

Additionally, when i was processing data i realized that average instagram usage is higher on weekdays, potentially due to increased workdays.

5. Insights and Recommendations

- The correlation coefficient of -0.0838 indicates a weak relationship between Instagram and WhatsApp usage times.
- The analysis highlights the need for further studies with larger datasets and additional context-specific variables.
- For balanced digital behavior, consider incorporating other metrics like total screen time and engagement quality into future studies.

6. Conclusion

The analysis finds no significant correlation between Instagram and WhatsApp usage times. This suggests that the usage of one platform does not strongly predict the usage of the other. These findings serve as a foundation for understanding personal digital behavior and encourage broader investigations into social media habits.

This integrated report summarizes the analysis, hypothesis testing, and findings, providing a comprehensive view of the relationship between Instagram and WhatsApp usage.
